The purpose of this work is to delineate electrooxidation of methanol using hierarchical platinum-bismuth nanodendrites as an electrocatalyst. Potentiostatic electrochemical method was applied to prepare the nanostructures. The shape of nanostructures was controlled by varying the concentration of Pt Cl\textsubscript{6}\textsuperscript{2−} ions in fixed Bi\textsuperscript{3+} ions and reaction time. The prepared nanocomposites were characterized by SEM, EDX, XPS and CV techniques. The electrocatalytic activity of Pt–Bi nanodendrites was studied towards methanol oxidation. The prepared nanostructures are simple, eco-friendly and with high electrocatalytic activity.

Keywords: Bismuth, Platinum, nanodendrites, electrochemical method, methanol oxidation
