One of the important aspects in biotechnology is the development of a rapid and selective approach for the identification and quantization of Escherichia coli (E. coli) bacteria. In this research, we fabricated a novel Label-free electrochemical E. coli biosensor based on oriented immobilization of T4 biotinylated bacteriophage as recognition receptor of E. coli on streptavidin immobilized on polyanilin (PANI) glassy carbon (GC) modified electrode. Labeled PANI was synthesized by chemical method and characterized by Raman and cyclic voltammetry (CVs) and field emission scanning electron microscope (FESEM). The bacteriophage/PANI/GC electrodes were applied as indicator electrodes for capacitance determination of E. coli bacteria. By fabricating this biosensor, E. coli was sensed in a linear range and detection limit of $10^{-98}$ N/mL and $10$ N/mL (N stands for number of E. coli) respectively. The proposed biosensor shows fast response time of $\sim 1$ s and good selectivity over other bacteria. We successfully developed and implemented an E. coli biosensor based on oriented bacteriophage immobilization on PANI modified GC electrode. This biosensor is cost-effective, rapid, renewable and high selective for detection of E. coli bacteria. Also, this method can be extension to detection of other biological agents.

Keywords: E. coli, bacteriophage T4, capacitance, biosensor, PANI.
