In this study, an electrochemical sensor based on a novel composite of reduced graphene oxide (GO) and multi-walled carbon nanotube (CNT) was developed for the detection of 2-hydroxy-3-methylanthracaquinone. First, GO was employed to disperse CNT as a dispersant. Then GO was reduced electrochemically into RGO after being deposited on the surface of ITO. Thus, the designed electrochemical sensor based on RGO/CNT/ITO for detecting 2-hydroxy-3-methylanthracaquinone was first reported. Cyclic voltammetry and electrochemical impedance spectroscopy (EIS) were employed to analyse the sensor. The results indicated that the sensor exhibited an electrocatalytic activity for the reduction of 2-hydroxy-3-methylanthracaquinone. In particular, the electrochemical reduction of 2-hydroxy-3-methylanthracaquinone was remarkably enhanced by the RGO/CNT composite. Besides, the sensor was efficient in determining 2-hydroxy-3-methylanthracaquinone in *Hedyotis diffusa*, where the sensor exhibited a linear response range from 2 to 600 μM.
