In this paper, composite of poly ortho-aminophenol containing Fe₂O₃ with nanosize particles was synthesized by a simple and one-step method. The characteristics of products such as morphology, magnetic properties and electrical conductivity were studied. The scanning electron microscopy (SEM) and X-Ray Diffraction (XRD) studies indicated controllable morphology and the effect of the presence of Fe₂O₃ phase in the nanocomposit. The synthesized nanocomposite has good conductivity and magnetic properties, depended on the presence of iron oxide nanoparticles in the range of 30-60 nm. For the conducting nanocomposite the saturation magnetization (Mₛ) was 0.539 emu/g and the electrical conductivity was 0.37 S/cm, which are measured by vibrating sample magnetometer (VSM) and four-probe technique, respectively.

Keywords: Conducting polymer, Poly ortho-aminophenol, Iron oxide, Nanocomposites.
